PROFILE

Backend Software Engineer with 2 years of experience designing distributed and event-driven systems at scale. Currently part of the core **CrawlInfra** team at **Tracxn Technologies**, building **Kafka-driven orchestrators**, backend data pipelines, and internal **REST APIs**. Previously **SDE at Amazon**. Interned twice as a **Full Stack Developer at Fidelity Investments**. Proficient in **Node.js**, **JavaScript**, **Kafka**, **SQL**, and **AWS**. Strong foundation in backend system design and scalable service architecture. Solved **1000+** DSA problems across LeetCode.

EDUCATION

The National Institute of Engineering

Mysore, Karnataka

Bachelor of Engineering - Information Science and Engineering - **CGPA: 8.00**

2020 – 2024

SKILLS

Backend: JavaScript, Node.js, Kafka, Java, Spring Boot, REST APIs, Distributed Systems, Event-Driven Architecture, Microservices, Redis, System Design

Database: SQL, PostgreSQL, MySQL, MongoDB

Cloud & Infrastructure: AWS, Linux, Git, CI/CD

Other: Agile, JWT, WebSockets

EXPERIENCE

Software Engineer

December 2025 – Present

Tracxn Technologies, Bengaluru, KA

- Designed and built **Node.js-based orchestrator systems** for Tracxn's core **CrawlInfra** platform, managing end-to-end crawler lifecycle including workflow execution, dependency resolution, retry strategies, failure recovery, and operational monitoring across distributed backend services.
- Developed and Onboarded **legal case crawlers from scratch** — conducted domain research and rate-limit analysis, designed crawl strategies, implemented retry and fault-tolerance mechanisms, and integrated crawlers into the orchestration pipeline for reliable, large-scale data acquisition across diverse legal sources.
- Engineered a **Node.js on-demand ec2 consumer** to execute a **6-million-file data backfill** — parallelized **gzip decompression**, staged and grouped records into an on-disk **SQLite** store, parsed data into the target schema, and published processed payloads to a downstream **Kafka parsing topic** owned by a partner team, enabling large-scale historical data backfill without disrupting live systems.
- Architected and implemented an automated **financial data acquisition pipeline** to handle 250+ jobs per day, coordinating across multiple engineering teams to orchestrate crawler execution, data processing workflows, and operational visibility for Tracxn's financial data systems.
- Built **Kafka-driven asynchronous workflows** enabling reliable, high-throughput communication between distributed crawl services, decoupling execution stages and improving pipeline stability for critical data operations.
- Provisioned and managed **AWS infrastructure** — including **S3**, **ec2**, **IAM roles**, **autoscaling**, and deployment pipelines — to support scalable backend workflows and large-scale data processing for crawl infrastructure systems.
- Developed **RESTful APIs** for internal transaction and workflow management modules, enabling cross-team integrations and standardizing access to crawl execution and monitoring capabilities.

Amazon, Bengaluru, KA

- Engineered backend APIs for the **Refill Reminder** system in **Amazon Pharmacy** using **Java** and **Spring Boot**, enabling automated **email/SMS/IVR notifications** that increased prescription refills by **28%**.
- Spearheaded modernization of a legacy **prescription verification service** by migrating the codebase to **Java JDK 17**, eliminating a year-long critical tech debt.
- Co-developed **Code Guardian**, an **AWS**-based static analysis and hybrid **CI/CD** platform integrated across **five major business pipelines**, reducing team PE risk by **50%**.

PROJECTS

InfraTrack

Java, Spring Boot, JPA, REST APIs, MySQL, JWT, Git

GitHub: github.com/ambrsumn/Infra-Track

- Designed and developed a backend-driven project management platform with **RESTful APIs** for workflow management, order placement, negotiation, and real-time delivery tracking.
- Implemented **JWT authentication** and **role-based access control** with Spring Boot, enabling secure, multi-role workflows across the system.
- Modelled normalized relational schemas in **MySQL** to support multi-entity workflows, adopted by **20+ engineers and staff** at EHDJV, eliminating manual coordination overhead.
